

Field Trip Report to Chapman Chemical - March 2, 1981

Bob Bledsoe and Bob Jensen were called and told that the facility changes required by Industrial Waste had been completed. They have installed the sump pump and replumbed the existing separator so that the only means of discharge is by pumping. The boiler water is rerouted so as not to enter the separator. The only thing left is the electrical connection for the sump pump.

Crosby Overton was on-site pumping out wastes left by Pacific Resins. These were housed in tanks in the building.

Everything is progressing well; they are still quite a few weeks from production.
